

App Backend Code Hosting Option	Hosting option	RAM	CPU	Storage	Monthly Cost	Free Trial / Period	Pros	Cons
	Hostinger VPS (KVM 1)	4 GB	1 vCPU	50 GB NVMe	~\$5.99	None	- Extremely high RAM (4GB) for the price. - Faster NVMe storage.	Requires a 12 or 24-month commitment to get the lowest price.
	AWS EC2 (t3.micro)	1 GB	2 vCPU	30 GB SSD	\$0.00 (Year 1) ~\$10.00 (Year 2+)	12 Months Free	- Free for the first year. - Integration with the full AWS ecosystem.	Complex setup dashboard. Pay-as-you-go billing can vary slightly based on data transfer.
	AWS Lightsail (1 GB)	1 GB	1 vCPU	40 GB SSD	\$5.00	3 Months Free	- Flat-rate predictable billing. - Much simpler dashboard than EC2. - First 3 months are free.	1 GB RAM is lower than Hostinger's 4 GB (though enough for this app).
	AWS Lightsail (512 MB)	512 MB	1 vCPU	20 GB SSD	\$3.50	3 Months Free	- Cheapest paid AWS option. - Ideal for small APIs and light cron jobs.	Lowest RAM, might struggle if you run multiple projects on the same server.
App Backend Data Storage Option	Plan / Tier	Storage Capacity	RAM & CPU	Backup Options	Est. Monthly Cost	Best Used For	Why Choose It? (Our Suggestion)	
	M0 (Free Tier)	512 MB	Shared (Low compute)	None	\$0.00	Development & local testing.	Free to start. Perfect for building the app, but not safe for production as it will run out of space once historical order data accumulates.	
	Serverless (Highly Recommended)	Autoscaling (Up to 1 TB)	Dynamic CPU/RAM (scales up on demand)	Daily Backups (costs extra per GB)	~\$5.00 to \$15.00 (Pay-as-you-go based on actual queries)	Small to medium apps with periodic background sync jobs.	Best value for this project. Since your CSV sync script runs once an hour and is idle the other 59 minutes, you only pay for resources when the script is active.	
	M10 (Dedicated)	10 GB (Scalable)	2 GB Dedicated RAM (No shared cpu)	Daily automated snapshots with 2-day retention	~\$57.00 (Flat-rate billing)	High-traffic production apps that require guaranteed, consistent performance.	Best for business reliability. Choose this if you want predictable flat-rate monthly pricing and dedicated CPU resources that never slow down.	

Summary of What You Will Pay Now (Year 1)

Service / Resource	Is it Free?	Free Period	Free Limits	Standard Cost (After Free Period)	Expected Monthly Cost for Your App
AWS EC2 Server (t3.micro)	Yes (New Accounts)	12 Months	750 Hours/Month (covers 1 server 24/7)	~\$7.50 / month	\$0.00 (Year 1) ~\$7.50 (Year 2+)
AWS Disk Storage (30 GB gp3)	Yes (New Accounts)	12 Months	Up to 30 GB SSD storage	~\$2.40 / month	\$0.00 (Year 1) ~\$2.40 (Year 2+)
AWS Static IP (Elastic IP)	No	None	None (Charged from Day 1)	~\$3.60 / month (\$0.005/hour)	~\$3.60 / month
MongoDB Atlas (Serverless / Flex)	No	None	None (Charged from Day 1)	Pay-as-you-go based on database operations	~\$5.00 to \$12.00 / month (based on hourly CSV sync traffic)
Summary of What You Will Pay Now (Year 1):					
Your client's total bill at the end of each month during the first year will be:					
AWS Bill : ~\$3.60 / month (only for the Static IP).					
MongoDB Atlas Bill : ~\$5.00 to \$12.00 / month (based on reads/writes).					
Total Estimated Bill : ~\$8.60 to \$15.60 / month !
