

| App Backend Code Hosting Option | Hosting option                  | RAM                      | CPU                                   | Storage                                        | Monthly Cost                                               | Free Trial / Period                                                           | Pros                                                                                                                                                                     | Cons                                                                                     |
|---------------------------------|---------------------------------|--------------------------|---------------------------------------|------------------------------------------------|------------------------------------------------------------|-------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
|                                 | Hostinger VPS (KVM 1)           | 4 GB                     | 1 vCPU                                | 50 GB NVMe                                     | ~\$5.99                                                    | None                                                                          | <ul style="list-style-type: none"> <li>Extremely high RAM (4GB) for the price.</li> <li>Faster NVMe storage.</li> </ul>                                                  | Requires a 12 or 24-month commitment to get the lowest price.                            |
|                                 | AWS EC2 (t3.micro)              | 1 GB                     | 2 vCPU                                | 30 GB SSD                                      | \$0.00 (Year 1)<br>~\$10.00 (Year 2+)                      | 12 Months Free                                                                | <ul style="list-style-type: none"> <li>Free for the first year.</li> <li>Integration with the full AWS ecosystem.</li> </ul>                                             | Complex setup dashboard. Pay-as-you-go billing can vary slightly based on data transfer. |
|                                 | AWS Lightsail (1 GB)            | 1 GB                     | 1 vCPU                                | 40 GB SSD                                      | \$5.00                                                     | 3 Months Free                                                                 | <ul style="list-style-type: none"> <li>Flat-rate predictable billing.</li> <li>Much simpler dashboard than EC2.</li> <li>First 3 months are free.</li> </ul>             | 1 GB RAM is lower than Hostinger's 4 GB (though enough for this app).                    |
|                                 | AWS Lightsail (512 MB)          | 512 MB                   | 1 vCPU                                | 20 GB SSD                                      | \$3.50                                                     | 3 Months Free                                                                 | <ul style="list-style-type: none"> <li>Cheapest paid AWS option.</li> <li>Ideal for small APIs and light cron jobs.</li> </ul>                                           | Lowest RAM, might struggle if you run multiple projects on the same server.              |
|                                 |                                 |                          |                                       |                                                |                                                            |                                                                               |                                                                                                                                                                          |                                                                                          |
| App Backend Data Storage Option | Plan / Tier                     | Storage Capacity         | RAM & CPU                             | Backup Options                                 | Est. Monthly Cost                                          | Best Used For                                                                 | Why Choose It? (Our Suggestion)                                                                                                                                          |                                                                                          |
|                                 | M0 (Free Tier)                  | 512 MB                   | Shared (Low compute)                  | None                                           | \$0.00                                                     | Development & local testing.                                                  | <b>Free to start.</b> Perfect for building the app, but not safe for production as it will run out of space once historical order data accumulates.                      |                                                                                          |
|                                 | Serverless (Highly Recommended) | Autoscaling (Up to 1 TB) | Dynamic CPU/RAM (scales up on demand) | Daily Backups (costs extra per GB)             | ~\$5.00 to \$15.00 (Pay-as-you-go based on actual queries) | Small to medium apps with periodic background sync jobs.                      | <b>Best value for this project.</b> Since your CSV sync script runs once an hour and is idle the other 59 minutes, you only pay for resources when the script is active. |                                                                                          |
|                                 | M10 (Dedicated)                 | 10 GB (Scalable)         | 2 GB Dedicated RAM (No shared cpu)    | Daily automated snapshots with 2-day retention | ~\$57.00 (Flat-rate billing)                               | High-traffic production apps that require guaranteed, consistent performance. | <b>Best for business reliability.</b> Choose this if you want predictable flat-rate monthly pricing and dedicated CPU resources that never slow down.                    |                                                                                          |
